

Hiloomy - Google Ads API Tool Design

Internal reporting tool for our own e-commerce brands. Prepared for the Google Ads API Basic Access application.
<https://www.hiloomy.com>

1. Business model

Hiloomy is an internal profit-and-operations dashboard built and operated by our company for the online stores we own and run (Incense Parfums and Take a Nap, both on Shopify). It combines store sales, product costs, inventory, Meta Ads and Google Ads in one place so the brand manager can see which campaigns are profitable. Hiloomy is not sold, licensed or offered to third parties. There is no advertising-agency use and no access for customers outside our company.

2. What the Google Ads API integration does

The integration is **read-only reporting**. Once per day (and on a manual 'Sync now' click) Hiloomy pulls campaign-level daily metrics for the connected ad account and stores them in our own database. The dashboard then shows spend, clicks, impressions, conversions, conversion value, ROAS and cost per conversion per campaign, side by side with Meta Ads for the same date range, and compares them to the store's break-even ROAS derived from Shopify order margins.

The tool does **not** create, edit, pause or delete campaigns, ad groups, ads, keywords, budgets, bids, audiences or conversion actions. It sends no mutate requests of any kind.

3. API services and fields used

Call	Purpose
CustomerService.ListAccessibleCustomers	Let the signed-in user pick which ad account to connect
GoogleAdsService.Search (GAQL) on customer_client	List client accounts under the manager, one level deep
GoogleAdsService.Search (GAQL) on campaign	Daily metrics: campaign.id, campaign.name, campaign.status, campaign.advertising_channel_type, segments.date, metrics.cost_micros, metrics.impressions, metrics.clicks, metrics.conversions, metrics.conversions_value

4. Authentication and account access

Users sign in to Hiloomy and connect Google Ads through standard Google OAuth 2.0 (scope: <https://www.googleapis.com/auth/adwords>) using our Google Cloud project's OAuth client. Only accounts the signed-in user already has access to in Google Ads can be selected. All accounts accessed are owned by our company and linked under our manager account (MCC). The developer token is stored as a server environment variable and never exposed to the browser.

5. Users

Internal users only: the company owner and brand manager. Access to Hiloomy itself requires a login; there is no public sign-up.

6. Data handling and security

Retrieved campaign metrics are stored in our PostgreSQL database (hosted on Supabase) keyed to the connected account, for 90 days of history plus ongoing daily rows. OAuth refresh tokens are encrypted at rest. Data is used only to render our internal dashboard and is never shared, sold or combined with other advertisers' data. Disconnecting the account in Settings removes the stored token; stored metrics can be deleted on request.

7. Request volume and quota

Very low: one scheduled sync per connected account per day (two accounts), plus occasional manual refreshes. The sync issues a handful of Search requests per account. Expected total is well under 1,000 API operations per day. Requests are paged and respect rate limits; failed syncs are logged and retried on the next scheduled run, not in a loop.

8. Screens

Settings > Google Ads: 'Connect Google Ads' button, ad-account picker, 'Sync now', last-sync time.

Dashboard > Google Ads campaigns: table of campaigns for the selected date range (spend, clicks, CTR, conversions, CPA, ROAS) with totals, next to the equivalent Meta Ads table and the store break-even line.

Contact: the API contact email registered in the Google Ads API Center for our manager account.
